

SHOGUN

James Clavell's Shogun — A Concise 420-Point Walkthrough, with an Opcode Census

Infocom, 1989 (`stories/Shogun/Story.data.z6`, Z-machine version 6), played on the zAI-Machine interpreter with random seed 42. Final result: **420 of a possible 420**, rank *Regent*. All eighteen scored scenes finish at their maximum, and nobody dies on the way. Every command below is replayed by `ShogunWalkthroughTests.Shogun_PerfectScore`. The test also tallies each opcode executed (see the Opcode Census at the end).

Solved during play using only the game manual (`stories/Shogun/Shogun_Manual`), with no outside walkthrough and without the in-game HINT system. The interpreter's disassembler, a parser for the V6 object table, and global/memory inspection were used to understand puzzles. This is how the following were found:

- the scene score tables and the "point token" objects;
- the grid behind the Osaka street maze;
- the timing windows in the courtyard, at the wharf and at the inn.

Know Before You Go

- **Nineteen scenes, scored separately.** Shogun is split into scenes (the Bridge, Mura's House, the Pit, ...), and each has its own maximum. SCORE shows both the scene and the overall total. A scene ends with "[Type any key to continue]" and a menu whose first item is CONTINUE. In the command list, **K** is the keypress and **<CR>** is Enter on the menu. The very first input is also **<CR>**, at the title menu.
- **Points are awarded for story beats.** Each scored action clears a hidden "token" attribute on an object and adds 5 points. A scene's maximum is five times its token count. Several tokens exist only for a single turn. Examples: watching Kiritsubo while everyone else looks at Sazuko, shouting *mizu* over the fainted Mariko, and checking your sword belt before bowing to Ochiba.
- **Timing matters.** Most scenes run on timed events. The WAITs in the route are deliberate, and dropping one usually misses an event later. In the inn at Yokose, Yoshinaka patrols the corridor, so the visit to Mariko is timed to happen while he is inside a room.
- **Japanese helps.** The manual's glossary is useful: *konnichi wa*, *hai*, *teki* (enemy), *mizu* (water), *hatamoto*. The parser accepts these words as commands.
- **NOTIFY** at the start turns on "[Your score just went up.]" messages. They make it easy to see which actions score.

Interpreter Bugs Found and Fixed

- **EXT opcode numbering off by one (crash at the first instruction).** EXT 20–29 were mis-numbered. Shogun's first instruction, `@mouse_window -1` (EXT:23), was dispatched as `@read_mouse`, which tried to write to address \$FFFF. The table is now 20 scroll_window, 21 pop_stack, 22 read_mouse, 23 mouse_window, 24 push_stack, 25 put_wind_prop, 26 print_form, 27 make_menu, 28 picture_table, 29 buffer_screen. Journey's old "crashes without Blorb" test now checks that it starts.

- **Missing V6 opcodes.** Added `@push_stack` (branch), `@pop_stack`, `@print_form`, `@make_menu` (branch, reports no menu bar), and the V6 form of `@pull`, which stores its result and can pop a user stack. The interpreter and the disassembler now decode branch bytes for EXT 6, 24 and 27.
- **Sentence space.** ZSCII 11 (Standard §3.8.2.1) was printed raw. It now prints as a space on screen and in transcripts. Memory streams still receive the raw code.
- These fixes are covered by `V6StackAndFormOpcodeTests` (9 tests).

Opcode Census

Every instruction executed during the run was decoded with the interpreter's own disassembler and counted by mnemonic. The run used **91 distinct opcodes** over **1,375,355** instructions. As a version 6 story, Shogun adds the window and graphics family (`draw_picture`, `picture_data`, `window_style`, `get_wind_prop`, ...). It also keeps a private user stack through `push_stack/pop_stack/pull`, and calls `mouse_window` at startup. `print_form` and `make_menu` are implemented but were not reached on this route. After the epilogue the game waits at its Restore/Restart/Quit menu, which is where the tally stops.
